Section 4.1

- The General Antiderivative of f(x) on an interval is F(x) + C, where C is any real number constant, if $\frac{d}{dx}(F(x) + C) = f(x)$.
- The collection of all antiderivatives of a function, f(x), is called the indefinite integral, and is denoted by $\int f(x) dx$ (the indefinite integral of f(x) with respect to x). If we know one function F(x) for which F'(x) = f(x), then $\int f(x) dx = F(x) + C$.
- Rules of Integration:
 - $\int k \ dx = kx + C$, where k is any real number
 - $\int x^n dx = \frac{1}{n+1}x^{n+1} + C$, where n is any real number with $n \neq -1$
 - $\int x^{-1} dx = \int \frac{1}{x} dx = \ln|x| + C$
- $\int b^x dx = \frac{1}{\ln b} \cdot b^x + C$ where b is any positive real number
 - $\bullet \quad \int e^x \ dx = e^x + C$
 - $\int (f(x) \pm g(x)) dx = \int f(x) dx \pm \int g(x) dx$

(a)
$$\int x^4 dx = \frac{1}{4+1} \chi^{4+1} + C = \frac{1}{5} \chi^5 + C$$

Check:

$$\frac{d}{dx} \left(\frac{1}{5} x^5 + C \right)$$

2. Find
$$f(x)$$
 if $f'(x) = \frac{3e^{-2x} + 4e^{-x}}{2e^{-2x}}$ and $f(0) = 5$.

(1) Find the general antiderivative $\frac{1}{2e^{-2x} + 4e^{-x}}$

*we are being asked to find a specific antiderivative *

Diring the general antiderivative
$$f(x) = \int f'(x) dx = \int \frac{3e^{-2x} + 4e^{-x}}{2e^{-2x}} dx = \int \left(\frac{3e^{-2x}}{2e^{-2x}} + \frac{4e^{-x}}{2e^{-2x}}\right) dx$$

$$= \int \left(\frac{3}{2} + 2e^{-x^{-(-2x)}}\right) dx = \int \left(\frac{3}{2} + 2e^{x}\right) dx = \frac{3}{2}x + 2e^{x} + C$$

$$\text{(2) Use } f(0) = 5 \text{ to solve } \text{ for } C:$$

$$f(x) = \frac{3}{2}x + 2e^{x} + C$$

$$f(x) = \frac{3}{2}x + 2e^{x} + C$$

$$5 = 2 + C$$

$$f(x) = \frac{3}{2}x + 2e^{x} + C$$

$$5 = \frac{3}{2}(0) + 2e^{0} + C$$

$$3 = C$$

$$f(x) = \frac{3}{2}x + 2e^{x} + 3$$

(2) use
$$f(0)=5$$
 to solve for C:
 $f(x) = \frac{3}{2}x + 2e^{x} + C$ $\Rightarrow 5 = 2 + C$
 $f(x) = \frac{3}{2}(0) + 2e^{0} + C$ $\Rightarrow 3 = C$

$$f(x) = \frac{3}{2}x + 2e^{x} + 3$$

3. Find the cost of producing 10 items if the marginal cost, in dollars per item, is given by $f(x) = 150 - 0.01e^x$, where x is the number of items produced. Assume the fixed costs are \$100.

We need C(10).

C(0) = 100

1) Find the general antiderivative

ind the general antiderivative
$$C(x) = \int (150 - 0.01e^{x}) dx = 150x - 0.01e^{x} + K$$

(3) Plug K into C(x)
$$C(x) = 150x - 0.01e^{x} + 100.01$$
(4) Find C(10)
$$C(10) = \frac{50(10) - 0.01e^{10} + 100.01}{28[379.75]}$$

Section 4.2

- We use u-substitution when our integrand is the result (or nearly the result) of the Chain Rule. We follow the process outlined below:
 - Select u (look for function of x where you normally have just x) $\int \frac{u^n}{u^n} \cdot (\text{other stuff}) \ dx \ \text{OR} \ \int \frac{1}{u^n} \cdot (\text{other stuff}) \ dx \ \text{OR} \ \int \frac{1}{u^n} \cdot (\text{other stuff}) \ dx$
 - Take the derivative of u using $\frac{du}{dx}$ notation.
 - Bring dx to the right hand side.
 - Bring any constant multiples to the left-hand side.
 - Substitute to replace all terms with x's.
 - Integrate with *u*'s.
 - Return x's into the problem.

4. Evaluate the following integrals:

(a)
$$\int \frac{8x + 21x^{2}}{4x^{2} + 7x^{3}} dx = \int \frac{1}{4x^{2} + 7x^{3}} \cdot \frac{(8x + 21x^{2}) dx}{dv}$$
$$= \int \frac{1}{v} dv$$
$$= |n|v| + C$$
$$= [n|4x^{2} + 7x^{3}] + C$$

$$\frac{dv}{dx} = 8x + 21x^{2}$$

$$\frac{dv}{dx} = 8x + 21x^{2}$$

Check:

$$\frac{d}{dx} \left(\ln |4x^{2}+7x^{3}| + C \right)$$
